In an effort to both simplify and standardize fire-monitoring practices, researchers at the U. S. Geological Survey (USGS) have developed an inexpensive and compact temperature-logging device called the Firelogger. It provides critical data regarding many components of fire dynamics, and it is simple to carry, deploy, and retrieve. The waterproof Firelogger has been constructed for easy burial while allowing the heat resistant thermocouple cable and temperature sensor to extend out along the ground surface. In situations where burial of the Firelogger is not possible (e.g., rocky ground), the body of the logger must otherwise be protected from the heat of the fire. Once deployed, the Firelogger records one temperature reading each second, securing valuable information that the user can download from the logger. Data are easily downloaded and when transferred to a computer where they can be manipulated and graphed. This manual provides detailed instructions regarding logger configuration and field deployment, as well as data retrieval and manipulation. For a more detailed scientific background and justification, see Appendix A, and for a Firelogger supply list, see Appendix B.3.
